Process

A process is a collection of workflows that makes integration work. Any process can be scheduled to run at regular intervals.

The process listing page has download functionality. A user can download a whole set of processes - i.e download project in a zipped format to the local file system.

The below screenshot illustrates a process listing from where a single process can run. DBSync allows processes to run concurrently.

Create, Update and Delete Process

To create a new Process- "**Create New Process**" -

A user can navigate to process listing in two ways - either by clicking on the process name from the menu available in the navigation or by clicking on any particular project.#.

1. Enter a preferred **name** and **"Save"** to view the process on the **listing page.**
2. **"Edit"**- To **edit/change** the process name.
3. **"Delete"**- To Delete the process and all of its components from the system. ***Once deleted, a user will not be able to recover process, or any of its components, from the system***.
4. "Download"- Download the process in a zipped format in the Downloads folder of the local file system.
