

Validating UDF Using Console Connector

Configuring DBSync Environment

Create a project with Name "Test" in DBSync:

1. Create a process with name "Process_Test" inside a Test project.
2. Create a Workflow with name "WF_Test" on the Process_Test.
3. Configure at least one connector with valid credentials.
4. Choose the Trigger with the created Connector and any object.
5. Now, create a Rule. Choose a console connector and an object. Open the mapping link for mapping the fields in conjunction with "Append" Function - as shown in below screenshot:

Save and Close the Mapping Screen. Run the "Process_Test" to view the results in the console viewer of DBSync. The following highlighted snippet shows how different fields are appended.

.
