# Versions

The DBSync platform is available with two options:

1. On-Premise
2. On-Demand

On-Premise

On-Premise allows DBSync's platform to be configured and run on the company's infrastructure. As a result, this type of solution is most suited for predicted users.

Downloading and installing DBSync's platform on the company's infrastructure requires a simple, two-step, process:

- Login into Customer accounts with valid credentials to get the platform's landing page.
- Customers can download the best-suited version that meets their needs from Windows or Linux.
- Users will get the installation details in the **Downloads** folder, on the user's local file system.

The installation steps for the On-Premise is provided in the next article, the link can be accessed from here.

On-Demand

On-Demand does not require any internal network set-up, updates or incur maintenance cost. On-Demand can be run on any web-browser.
