

2 - Getting Started

Let's get started with DBSync Cloud Replication for source apps is database-agnostic, real-time replication software that's highly scalable, reliable, and nondisruptive to the performance of operational source systems.

DBSync Cloud Replication enables small and large enterprises to do a complete backup of their source apps cloud data into any JDBC compliant database or also have a real-time or batch synchronization of salesforce objects with the database.

Main Features of DBSync Cloud Replication

Start with the main features of DBSync Cloud Replication for source applications like Salesforce and Microsoft CRM.

- Auto-create source apps Object Schema into your database
- Replicate source apps Objects in Batch or Real-time into your database
- Create or update source apps records from your database tables
- Be up and running in minutes rather than days
- Supports Windows, Linux or Solaris platforms
