

# Release 6.4.3

Effective Release Date: **Sep 13th, 2019**

Release Notes:

- [Enhancements](#)
- [Minor Fixes](#)

## Enhancements

- No enhancements in this release only some minor fixes.

## Minor Fixes

- CDM query builder not working with column prefix when added in config props.
  - **Note:** Add the Column Prefix on Database Setup page inside the Advanced Setting details including Prefix settings.
- CDM export with a prefix not working for Postgres database.
  - This is the same as the first one but it includes Export Functionality.
- Replication still failing: Records was missing, now we have done some code changes and it is working fine as expected (It includes the telnet server details to run the sync).
- Email notifications not working with client's own SMTP server now is fixed.
- MS SQL database **table. multibyte property** is working now.
- Preserve log location for each **profile -> config.properties**, any changes are done on UI will not preserve changes done on this file.
- Profiles are created at a different location when we run as service.
  - To check the details go to the Service App and find out the Tomcat Properties that will show the latest version of Cloud Replication and CDM Build.
