# Release 6.6

Effective Release Date: Jan 30th, 2020
Release Notes:

Enhancements

- User and Role Management for Cloud and On-Premise. Ex: Now based on the User and Role management permissions user can access the Web API- /replicate and /CheckStatus permissions.
- Basic Auth support for DBSync API.
- Log Page: Auto Refresh button and Profile Name. Users will get the toggle button to Switch On/Off the Auto Refresh Functionality on Log Page.

Minor Fixes

- Override property should alter only the property present in the file. currently altering all the columns irrespective of the database datatypeproperty
  - If the user has to work on Override property then he/she has to do changes in the **system.properties**
    - **alter.schema.size=true**, By default is true if User has to do changes then make it **false**
    - **alter.schema.override=false**, By default is true if User has to do changes then make it **true**
- Cloud CDM WEB API issue- Profile has to work Based on the User and Role Management Permissions
- CSS pop up when session timeout issue
- DBSync log file date time format
- Table and Column rename backward compatibility issues. Get your 5x Profile data with all the fields in the 6x Version.
  - These 2 Properties users have to add in profile- **config.properties**
    - **adapter.type=salesforce**
    - **application=salesforce**
- Log page does not open after certain sync
- Salesforce BulkApi mode not querying more than 2 lakhs records issue.
  - **application.pkchunking.size=20000** (It depends upon how much records you want to run in one single sync)
- CDM Scheduler Issue.
- Rename of database type.
- Delete archived log entry from the H2 DB.
