

# Release 7.0

## Effective Release Date: 01/03/2020

To download this version from the following are the links for [Windows](#) and [Linux](#) downloads.

### Enhancements

- Add API Limit to Salesforce Connector page (Backup has it on Notification) but Replication should be on SF Page
- Add API Count on Logs
- Sort tables alphabetically on logs table

### Bug Fixes

- Create snapshot run command policy issue.
- Bulk API not working for opportunity and Task objects
- Logs rendered on new UI is not accurate or not right
- Cloud: issue while running all objects
- Log status on UI does not represent the correct state.
- In Restore page not able to select Object
- Log Page : sorting issue.
- Sync fails with an unknown exception.
- Issue with sorting logs on the UI and Run on logs page
- Setting API call limits on staging URLs does not work.
- Disable Clear Logs button and show only active users on report
- KVB : Incremental run with filter criteria issue.
- Sync process failed if we have column PREFIX + COLUMN NAME length exceeds DB column name limit
- No scripts work with new version of replication on Linux
- Cassandra DB logs page count mismatch issue
- Email report user activity block shows 6 users.
- Salesforce API limit consuming more API call issue
- Backup Now doesn't work if user has only SaaS-BR license
- Log Page : immediate updates of records written not showing (dev-2018).
- Attribute "mustUnderstand" bound to namespace "<http://schemas.xmlsoap.org/soap/envelope/>" was already specified for element "ns6:QueryOptions".
- Logs page - While log is running(In progress) the inner log Elapsed time gives random timings.
- Delete records are not updating in user report.
- Read & Download options for Logs are not present under Role Management
- Clicking on API under Administration tab lands on HTTP Status 500
- S3 & MongoDB is broken
- Scheduler page gives pop up for internal server error [500]
- Mongo DB connection issue : Cannot authenticate with password which contains @
- Test connection gives "No endpoint" error
- Salesforce Page : Not able to connect Salesforce through sandbox
- Sync fails randomly due to Rolling back transaction and shows the status as completed in the UI even when it has completed X%
- API Usage not showing up for update schema and Db to source command
- Metadata button enable/disable based on CDM Policy
- Metadata UI Pane Issue - Show latest sync and sync prior to latest sync
- Metadata Backup Role Management and Run Command
- Metadata Backup Scheduler Task
- On-Premise CDM API Limit Impose Min Value
- Logs page: Ordering of serial number on logs page is not proper
