

2. Getting Started

DBSync Cloud DataReplication for Salesforce is database-agnostic, real-time replication software that's highly scalable, reliable, and nondisruptive to the performance of operational source systems. It enables small and large enterprises to do a complete back-up of their Salesforce cloud data into any JDBC compliant Database or also have a real-time or batch synchronization of Salesforce objects with the database. Some of the main features of the DBSync Cloud Replication for Salesforce are

- Auto-create Salesforce Object Schema into your database
- Replicate Salesforce Objects in Batch or Real-time into your database
- Create or update Salesforce records from your database tables
- Be up and running in minutes rather than days
- Supports Windows, Linux or Solaris platforms

This section explains in detail about the steps involved to get started with DBSync Cloud Replication with the topics mentioned below.
