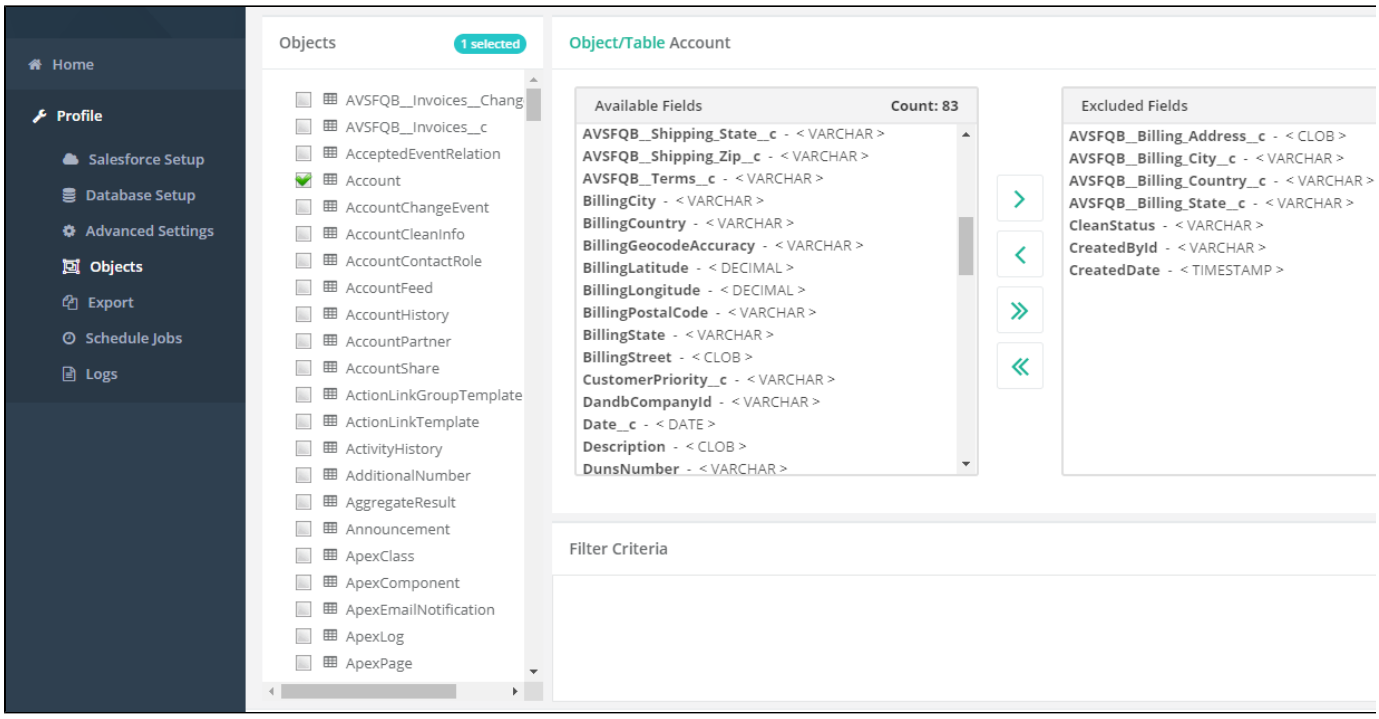
c. Filter Criteria

Filter Criteria in DBSync Cloud Replication can be used if replication from Salesforce to Database has to be done with certain conditions. Filter Criteria must be specified using ***SOQL***. The detailed illustration with example is shown below.

- 'Accounts' object in Salesforce is as shown below and the same needs to be replicated to database only when the ***Type is 'Customer – Direct' and SLA is 'Silver'***.

- In this scenario Type and SLA picklists with various options are as shown.

- In DBSync Cloud Replication, ***Filter Criteria*** is available under ***Salesforce Sync Object Details*** tab.



- SOQL must be used to meet the required criteria. ***API name*** must be used in SOQL. ***Filter Criteria*** must be ***saved*** before running the replication.

- After successful run, Accounts data from Salesforce, only of type 'Customer – Direct' and SLA 'Silver' will be replicated to database.
- Similarly various SOQL can be used to meet the requirement.
